

On modern Android phones, installing an APK directly from your website is fairly straightforward. The main obstacle is that Android normally blocks installation of apps obtained outside the Google Play Store. Your attendees will need to grant permission **once, specifically to the browser they used to download the APK.**

The exact wording varies slightly among Android versions and manufacturers (especially Samsung), but the process is broadly consistent.

What attendees should do

- 1. Open your workshop webpage on their Android phone**, using Chrome or their usual browser.
- 2.** Tap the APK download link.
- 3.** If the browser warns that the file might be harmful, choose **Download anyway** or the equivalent. This is a generic warning for APK files, not necessarily a finding that your particular file is dangerous.
- 4.** When the download finishes, tap **Open**. Alternatively, find the APK in the phone's Downloads folder and tap it.
- 5.** Android may display a warning such as *"For your security, your phone currently isn't allowed to install unknown apps from this source."*
- 6.** Tap **Settings**, then enable **Allow from this source** (sometimes labeled **Allow app installs**).
- 7.** Return to the installation screen and tap **Install**.
- 8.** When installation finishes, tap **Open** to run the calculator.

That's normally all there is to it.
